Update Guide

This guide explains how to safely update **Titan News** to the latest version. Please locate your current version below and follow the specific instructions.

Important Notice: Always Backup First!

Before starting *any* update process, make sure you carefully follow this step to avoid data loss or downtime.

Create a **complete backup** of your website, including:

- All Files & Folders
- Your MySQL Database

“ **Tip:** This ensures you can easily restore your site if anything goes wrong during the file transfer or database migration.”

Updating from v1.0.3 to v1.0.4 (Latest[5,6] upcoming all are same process)

Step 1: Upload New Application Files

1. Download and extract the latest **Titan News** package.
2. Open the extracted folder and locate the `source/` directory.
3. **Copy/Upload all files and folders** from inside `source/` directly into your server's **root directory** (overwriting the old files).

Step 3: Clear Cache & Verify

1. In the Admin Panel, go to **System Settings → System Maintenance**.
2. Click "**Clear All Cache**" (or run `php artisan optimize:clear` in the terminal).

Updating from v1.0.2 to v1.0.3

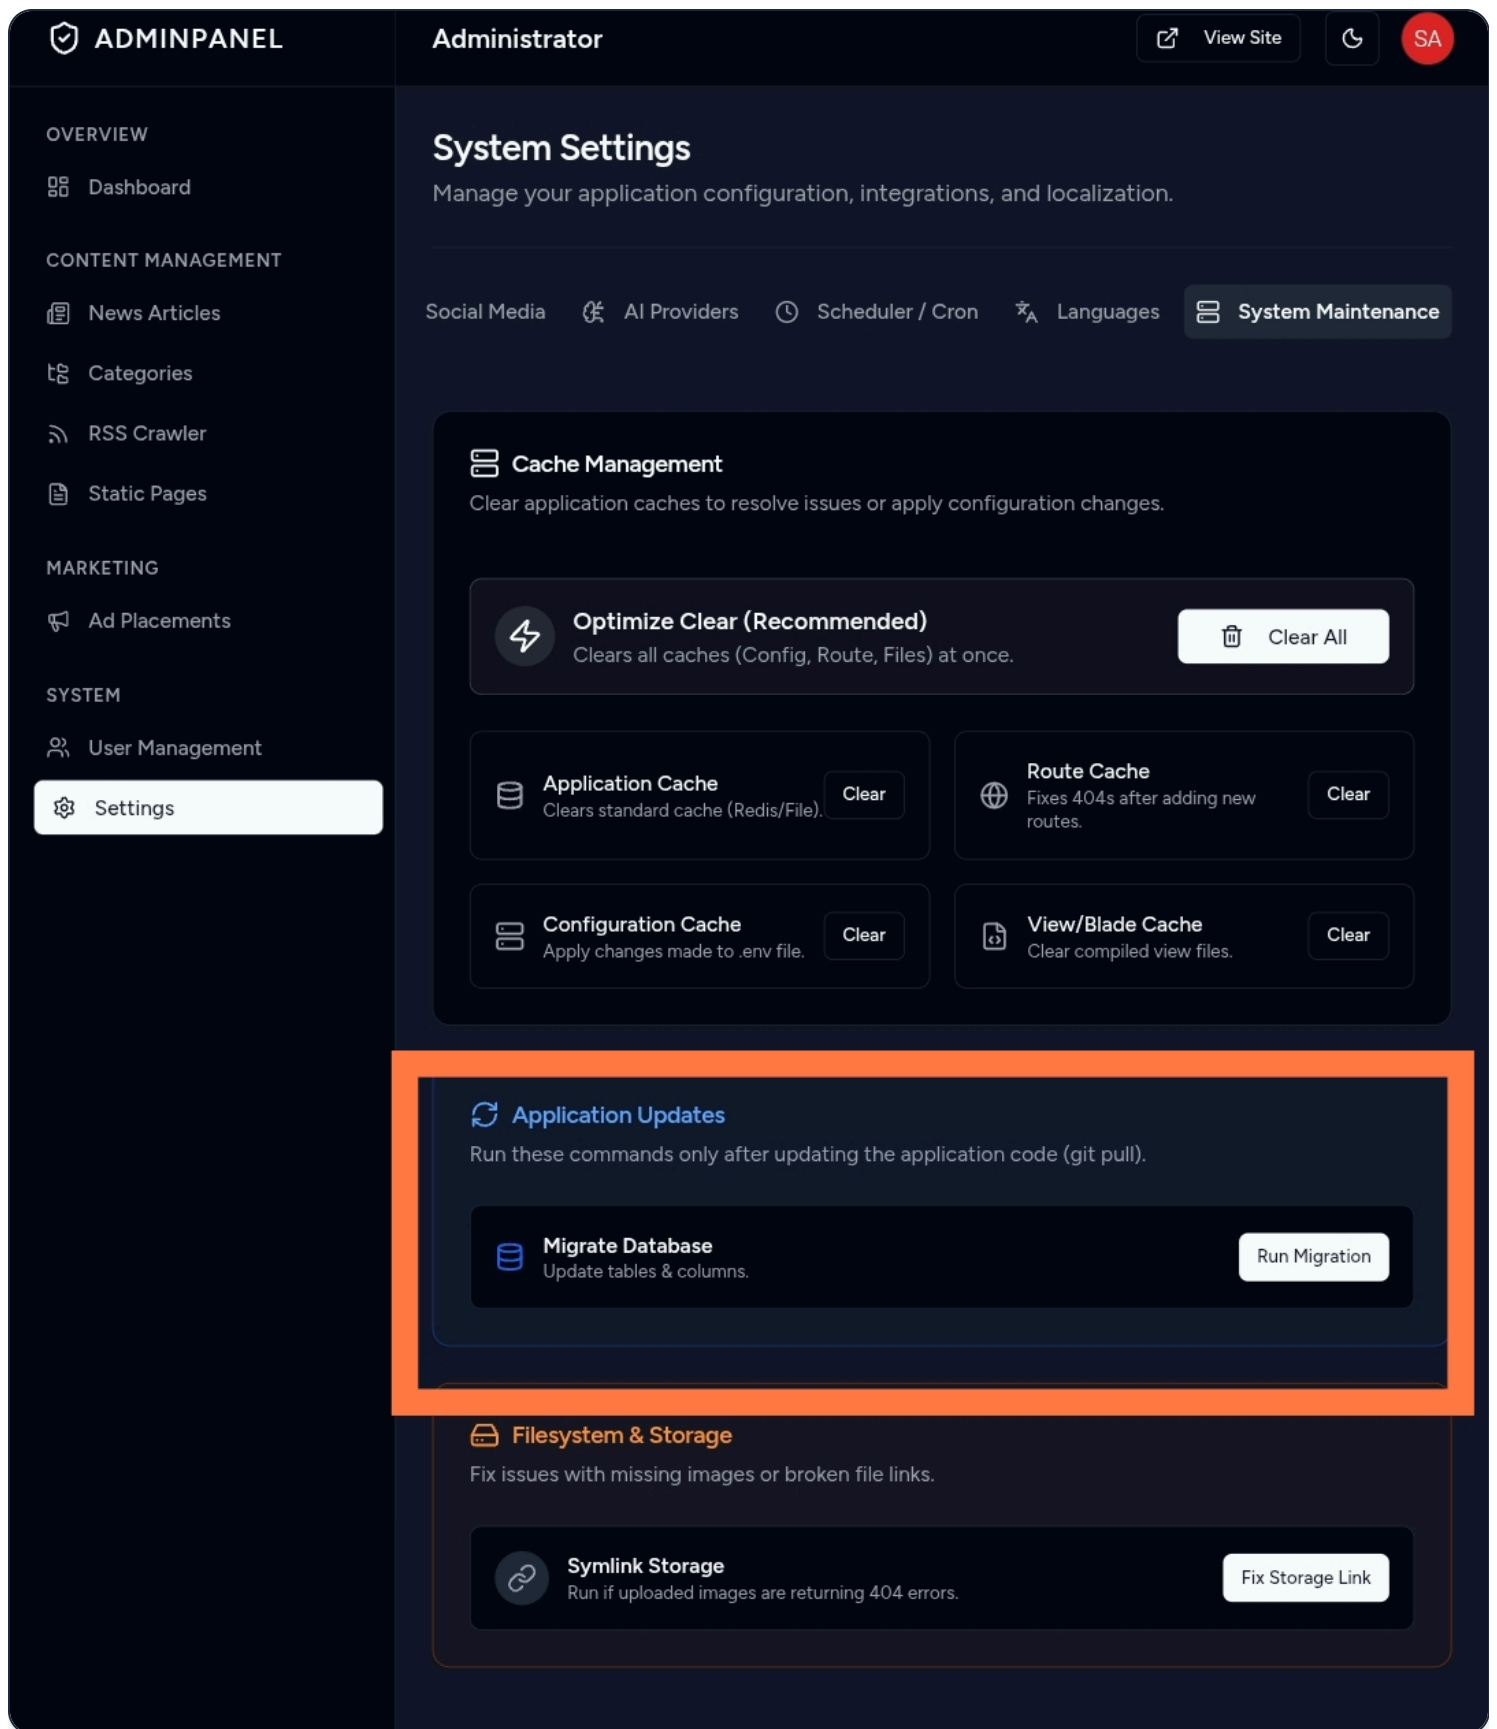

This update introduces new database structures (like the `settings` table adjustments and new features). You must run a database migration after uploading the files.

Step 1: Upload New Application Files

1. Download and extract the latest **Titan News** package.
2. Open the extracted folder and locate the `source/` directory.
3. **Copy/Upload all files and folders** from inside `source/` directly into your server's **root directory** (overwriting the old files).

Step 2: Run Database Migration

Because this version includes database changes, you must run the migration script. You can do this in one of two ways:

Option A: Via Admin Panel (Easy)

1. Log in to your **Admin Panel**.

2. Navigate to **System Settings → System Maintenance**.
3. Scroll down to the **Application Updates** section.
4. Click the "**Run Migration**" button.

Option B: Via Terminal / SSH (For VPS / Developers)

1. Connect to your server via SSH and navigate (`cd`) to your project root folder.
2. Run the following command:

```
php artisan migrate --force
```

Step 3: Clear Cache & Verify

1. In the Admin Panel, go to **System Settings → System Maintenance**.
2. Click "**Clear All Cache**" (or run `php artisan optimize:clear` in the terminal).
3. Look at the bottom of the left sidebar in the Admin Panel. You should now see **v1.0.3**.

 **Update Complete!**

Updating from v1.0.0 to v1.0.2 (Legacy)

If you are already on v1.0.2, you can skip this section.

Step 1: Upload New Application Files

1. Open the **Titan News** package.
2. Go to the `source/` folder.

3. **Move all files and folders** from `source/` directly into your **root directory**, overwriting the existing ones.

Step 2: Clear System Cache

1. Log in to the **Admin Panel**.
2. Navigate to **Settings → System Maintenance**.
3. Click on the **“Clear All Cache”** button.

Step 3: Verify the Update

1. Load your website in the browser to ensure everything looks correct.
2. Login to the **Admin Panel**.
3. Check the **bottom of the left sidebar**. You will see the **updated version number** displayed there.

Update Complete!
